**Easy loading Power Grip CO2 System**

- THE PERFECT SPRING GUN SHOT**  
Follow these 12 steps for improved results.
- Spring piston airguns take 500-1000 shots to fully break in. Groups may be erratic for the first 100 shots or so.
  - "Do not" bench rest on ANY solid object! Rest your hand and place the gun in your hand. Even better, buy an inexpensive sand bag and fill with sand.
  - Rest the stock on the sand bag. "Never" the barrel.
  - Do not pull the trigger if the barrel is bent down. The barrel will fly up, bend and could cause injury. A cracked and/or broken stock will occur. Guaranteed!
  - Whether your rifle is a break barrel or underlever, you should always keep one hand on the cocking lever.
  - Hold the gun "loosely" at the fore-end, at the grip, and in the shoulder. Spring guns become "inaccurate" if held tightly.
  - Changing your shooting position or grip can and will change your point of impact.
  - Scopes should be mounted 2.75" to 3" away from your eye.
  - Squeeze the trigger, don't jerk or pull it.
  - After squeezing the trigger, stay on target for a couple of seconds. Follow through is very critical!
  - \*Remember each rifle is an individual and has its own characteristics. To achieve the best performance, you should try a sampler pack of pellets to see which pellet your gun shoots the best.
  - Your rifle, your pellet, and your scope doesn't know where the target is. It's up to you to point it straight!
- Good luck and shoot straight! Courtesy of Beeman Precision Airguns  
**NEVER** allow anyone to 'dry-fire' any spring-piston airgun. That is, never fire an airgun without a pellet in it.
